ABSTRACT

A Bayesian analysis based on nrDNA and petN-psbM (combined 2054 bp) of putative *J. deltoides* from Azerbaijan, Bulgaria, Cyprus and Israel confirmed that they are in the clade with *J. deltoides* and well resolved from *J. oxycedrus*. There is some minor variation in *J. deltoides* (only a one or two bp differences in the entire *J. deltoides* clade). This study supports previous studies that show *J. deltoides* occurs from central Italy, eastward though the Mediterreanea to Azerbaijan as it eastern-most location. *Juniperus oxycedrus* appears to be confined to the western Mediterreanea. The taxa can easily be recognized by the deltoid leaf bases and exposed leaf scars on the tips of seed cones of *J. deltoides* versus the tapered leaf bases and smooth seed cone tips of *J. oxycedrus*. Published on-line www.phytologia.org Phytologia 97(4): 286-290 (Oct 1, 2015). ISSN 030319430.

KEY WORDS: *Juniperus deltoides*, *J. oxycedrus*, SNPs, nrDNA, petN-psbM, plant geography.

In 2004, Adams described a new species, *J. deltoides* R. P. Adams from the eastern Mediterranean that was morphologically similar to *J. oxycedrus* L., except in having deltoid shaped leaves that were broad at the leaf base and with protruding leaf scar bracts on the end of the seed cones. Subsequently, Adams et al. (2005) found large differences in nrDNA sequences confirming the taxonomic decision. Adams et al. (2005) confirmed that trees previously identified as *J. oxycedrus* in Greece, Turkey and central Italy were, in fact, the new species, *J. deltoides*. Additional gene sequencing of nrDNA plus four cp genes confirmed the initial DNA work in the phylogeny of *Juniperus* (Adams and
Schwarzbach, 2013, Adams, 2014). Juniperus based on nrDNA and five cp regions showed that J. deltoides was in a clade with J. navicularis and J. brevifolia, whereas, J. oxycedrus was in a clade with J. cedrus, J. macrocarpa and J. maderensis (Fig. 1).

Figure 1. Bayesian tree of Juniperus sect. Juniperus based on nrDNA and five cp regions. Notice that J. deltoides is in a well supported clade with J. brevifolia and J. navicularis, not in the clade with J. oxycedrus, J. maderensis, and J. cedrus. From Adams and Schwarzbach, 2012.

More recently, J. oxycedrus f. yaltirikiana Meral, Avci & Ziel., Turkey, has been shown (Adams and Mataraci, 2011) to be J. deltoides f. yaltirikiana (Meral, Avci & Ziel.) R. P. Adams and J. oxycedrus var. spilinanus Yalt., Elicin & Terzioglu was proved (Adams et al. 2010) to be J. deltoides var. spilinanus (Yalt., Elicin & Terzioglu) Terzioglu.

Adams and Tashev (2012) found that the volatile leaf oils of Juniperus deltoides in Bulgaria contained key components (cis-p-mentha-2,8-dien-1-ol, carvone, (2E)-decenal, α-copaene, α-copaen-11-ol, α-calacorene, cis-calamenen-10-ol, and cadalene that are absent in J. oxycedrus from France; indicating the

presence of *J. deltoides* in Bulgaria.

The purpose of the present study was to examine additional populations of putative *J. deltoides* in Azerbaijan, Bulgaria, Cyprus and Israel by nrDNA and petN-psbM sequencing to confirm the presence of *J. deltoides* in these regions.

**MATERIALS AND METHODS**

Plant material: *J. deltoides*, Adams 9430-9432, Turkey; Adams (Salih Gucel ns) 14544-14547, Cyprus; Adams 9436-9438, Archova, Greece; Adams 9445-9447, Riano, Italy; Adams (Tashev ns) 13126-13130, Bulgaria; Adams (Leshner ns) 14463-14465, Israel; Adams (Farzaliyev ns) 14466-14468, Azerbaijan; *J. d. var. spilinanus*, Adams (Mataraci ns) 12064-12066, Turkey. *J. d. f. valtirkiana*, Adams (Mataraci ns) 12393-12395, Zonguldak Prov., Turkey. Voucher specimens are deposited at Baylor University (BAYLU). Vouchers for other locations are reported in previous Adams, et al. papers (cited above).

One gram (fresh weight) of the foliage was placed in 20 g of activated silica gel and transported to the lab, thence stored at -20 °C until the DNA was extracted. DNA was extracted from juniper leaves by use of a Qiagen mini-plant kit (Qiagen, Valencia, CA) as per manufacturer's instructions.

DNA Amplifications and purification: see Adams, Bartel and Price (2009) and Adams and Kauffmann (2010). Sequences for both strands were edited and a consensus sequence was produced using Chromas, version 2.31 (Technelysium Pty Ltd.) or Sequencher v. 5 (genecodes.com). Sequence datasets were analyzed using Geneious v. R7 (Biomatters. Available from [http://www.geneious.com/](http://www.geneious.com/)) and the MAFFT alignment program. Further analyses utilized the Bayesian analysis software Mr. Bayes v. 3.1 (Ronquist and Huelsenbeck, 2003). For phylogenetic analyses, appropriate nucleotide substitution models were selected using Modeltest v3.7 (Posada and Crandall, 1998) and Akaike's information criterion.

**RESULTS AND DISCUSSION**

Sequencing nrDNA (ITS1 and ITS2 and flanking regions) gave 1274 bp of data and sequencing petN-psbM (spacer plus flanking regions) yielded 780 bp, for a total of combined of 2054 bp of data. A Bayesian analysis (Fig. 3) shows that all the putative *J. deltoides*, new to this study (Azerbaijan, Bulgaria, Cyprus and Israel), are in the clade with *J. deltoides* and well resolved from *J. oxycedrus*. There is some minor variation in *J. deltoides* (only a one or two bp differences in the entire *J. deltoides* clade).

As previously shown (Fig. 1), *J. deltoides* is part of the *J. navicularis* - *J. brevifolia* - *J. deltoides* clade. In contrast, *J. oxycedrus* is part of the *J. oxycedrus* - *J. macrocarpa* - *J. maderensis* - *J. cedrus* clade.

It is interesting to note that colonization of the Azores (*J. brevifolia*) appears to have come from ancestors similar to *J. navicularis* on the continent (Portugal) (Fig. 3). Whereas, colonization of the Canary Islands (*J. cedrus*) likely came from ancestors similar to *J. maderensis* (Madeira) or *J. oxycedrus* (Portugal, Spain or Morocco) (Fig. 3).
